NABTEB Past Questions and AnsWARY/JUl|leazog online www.myschoolgist.com.ng Question \& Model Answer
IN BASIC ELECTRICITY 194
Question 1
1a. (i) State ONE application of a capacitor
(ii) Capacitors $8 \mu \mathrm{f}, 12 \mu \mathrm{f}$ and $20 \mu \mathrm{f}$ are connected in a circuit

Calculate the resultant capacitance when connected in:
(i) Series
(ii) Parallel
b. State the factors which affect the resistance of a conductor

Solutions
(a) (i) Capacitor is used to store electric charges smoothing, power factor correction, motor starters etc
(ii) In series

|  |  |
| ---: | :--- |
| ${\frac{1}{C_{T}}}$ | $=\frac{1}{\mathrm{C}_{1}}+\frac{1}{\mathrm{C}_{2}}+\frac{1}{\mathrm{C}_{3}}$ |
|  | $=\frac{1}{8}+\frac{1}{12}+\frac{1}{20}$ |
|  | $=\frac{15+10+6}{120}=\frac{31}{120}$ |
| $\Rightarrow C_{T}$ | $=\frac{120}{31}=3.97 \mu \mathrm{f}$ |
| $\therefore C_{T}$ | $=\underline{\underline{3.87 \mu \mathrm{f}}}$ |

(iii)

(b) Factors that affect the resistance of a conductor

| The nature of the conductor |
| :--- |
| $\quad$ The length of the conductor |

For other subjects, go to http://www.myschoolgist.com.ng/NABTEB

NABTE. Pasfhe cross sectional areas of the conductor ${ }^{2}$.

* The temperature of the conductor
* The resistively of the conductor
$R \alpha L, \quad R \alpha \underline{A} \quad R \alpha$
$\therefore \mathrm{R}=\mathrm{eL}$ where $\mathrm{R}=$ Resistance of the conductor
A $\mathrm{L}=$ Length of the conductor
A $=$ cross sectional area of the conductor
$\mathrm{e}=$ Resistively (proportionality constant)

## Question 2

2a. Three resistors of resistance $10 \Omega, 15 \Omega$ and $60 \Omega$ are connected in series.
Another resistor of 17 is connected in parallel with the series group.
Calculate the total resistance of the combination
b. What are the characteristics of voltage and current in a series circuit?

Solution

$$
\begin{aligned}
& {\frac{1}{R_{P}}}^{=} \frac{1}{R_{1}}+\frac{1}{R_{2}} \mathrm{OR} \frac{1}{\mathrm{R}_{\mathrm{P}}}=\frac{1}{\mathrm{R}_{1}}+\frac{1}{\mathrm{R}_{2}} \\
& \underline{1}=1+1
\end{aligned}
$$

 $=\frac{1+85}{85}$

b. Characteristics of voltage and current in a series circuit
(i) The p.d across each resistor is different
(ii) The p.d across each resistor is less than the total p.d across the whole circuit
(iii) The current in all the resistors/lamp is the same
(iv) Total p.d the sums of the pds across the resistors

Question 3
3a. (i) Define electromotice force
(ii) State the unit and symbol of electromotive force
b. A dry cell of emf 3 v and an internal resistance of $0.5 \Omega$ is connected to a load resistance of $7 \Omega$
calculate
(i) the load current
(ii) the voltage drop across the internal resistance

## Solution

a. (i) electromotive force is defined as the potential difference (p.d) between the terminals of a cell when it is not delivering any current to the circuit or defined as the total energy generated per coulomb or defined as the p.d across the terminals of a cell on open circuit $\mathrm{E}=\mathrm{V}+\mathrm{I}$
(ii) The unit is volts (v) and the symiol is E

(i) Load current,

$$
\mathrm{I}=\frac{3}{7+0.5}=\frac{3}{7.5}
$$

$$
1=0.4 \mathrm{~A}
$$

(ii) Voltage across the internal resistance, $I_{r}$ is given as

$$
\begin{aligned}
\mathrm{I}_{\mathrm{r}} & =0.4 \times 0.5 \\
& =\underline{0.2 \mathrm{v}}
\end{aligned}
$$

Question 4
4. a. State the factors which affect the resistance of a conductor
b. Determine the range of resistance of a resistor which has the following colour codes; Blue, Black Red and Silver
c. Two resistance of values $10 \Omega$ and $20 \Omega$ are connected in parallel across a 240 v battery
(i) The total resistance
(ii) The total current
(iii) The energy consumed in the $12 \Omega$ resistor

Solution
a. Factors that affect the resistance of a conductor

* The nature of the conductor
* The length of the conductor
* The cross sectional area of the conductor
* The temperature of the conductor
* The resistively of the conductor
$R \alpha L, R \alpha L \quad R \alpha \underline{L}$
$\therefore \quad R=\frac{e L}{A}$
Where $\quad e=$ resistively of the conductor
L = length of the conductor
$\mathrm{A}=$ cross sectional are of the conductor
$\mathrm{R}=$ resistance of the conductor
b.

| Blue | Black | Red | Silver |
| :--- | :--- | :--- | :--- |
| 6 | 0 | 2 | $10 \%$ |
| 6 | 0 | 00 | $10 \%$ |
| 6000 | $\pm$ | $10 \%$ |  |
| $10 \%$ | $=$ | 0.1 |  |
| $6000 \pm 10 \%$ | $=$ | 5,400 or 6,600 |  |

C.
(i) Total Resistance

$$
\begin{aligned}
\frac{1}{\mathrm{R}_{T}} & =\frac{1}{\mathrm{R}_{1}}+\frac{1}{\mathrm{R}_{2}}=\frac{1}{10}+\frac{1}{20} \underline{2+1}=\underline{3} \\
\Longrightarrow \mathrm{R}_{\mathrm{T}} & =\underline{\underline{20}} 20 \\
\therefore \mathrm{R}_{\mathrm{T}} & =\underline{\underline{6.67 \Omega}}
\end{aligned}
$$

(ii) Total current
$\mathrm{I}_{\mathrm{T}}=\frac{\mathrm{V}}{\mathrm{R}_{\mathrm{T}}}=\frac{240}{6.67}$
$\mathrm{I}_{\mathrm{T}} \quad \underline{240}=35.98$
6.67
$\therefore \quad \mathrm{I}_{\mathrm{T}}=35.98 \mathrm{~A}$
(iii) The energy consumed in each resistor in iminute
$\mathrm{I}_{1}=\frac{\mathrm{V}}{\mathrm{R}_{1}}=\frac{240}{10}=24 \mathrm{~A}$
$I_{2}=\frac{V}{R_{2}}=\frac{240}{20}=12 \mathrm{~A}$
$\Longrightarrow E_{10}=\quad$ Ivt
$=\quad 24 \times 240 \times 60=$
345600
$\begin{aligned} \therefore \quad \mathrm{E}_{10} & =\underline{345.600 \mathrm{~J}} \\ \text { also, } \mathrm{E}_{20} & =\text { lvt }\end{aligned}$
$=12 \times 240 \times 60=172800$
$\therefore E_{20}=172.800 \mathrm{~J}$
Question 5
5. Draw the B.S. symbols of the following
i. Electric Bell

ii. Discharge lamp- $\longrightarrow$ OR-C-
iii. One way switch
iv. Ammeter

For other subjects, go to http://www.myschoolgist.com.ng/NABTEB
vi. Variable capacitor -
vii. Socket

viii. Diode

OR
ix. Cell

x. Autotransformer

Question 6
ba. i. Define capacitance
ii. State the THREE factors that determine the capacitance of a
capacitor
b. Three capacitors of values $6 \mu \mathrm{f}, 10 \mu \mathrm{f}$ and $14 \mu \mathrm{f}$ respectively are connected in series across 10 V d.c source. Determine
(i) The total capacitance of the group
(ii) The total charge stored by the capacitors
(iii) The energy stored in the circuit.

Solution
ai. Capacitance is the property of an isolated conductor or sets of conductor and insulator to store electric charge. It is defined as the ability of a capacitor to store electric charges. It can also be defined as the ratio of the amount of electricity (charge) to the potential difference (p.d) produced between the plates. It is symbolized by letter C and measured in farad (f). capacitance, C = Q/V.
ii. There factors that determine the capacitance of a capactior.

- The effective surface area of ovelap of the two parallel plates. $\mathrm{C} \alpha \mathrm{A}$
- The distance between the plates, ie $\quad \mathrm{C} \alpha 1$
$-\quad C \alpha \frac{A}{d} \quad$ and $\quad C=\frac{\varepsilon A}{d}$

NABTEB Past Questions and Answers - Uploaded online www.myschoolgist.com.ng b.

i. The total capacitance of the group

$$
\begin{aligned}
\frac{1}{\mathrm{C}} & =\frac{1}{\mathrm{C}_{1}}+{\frac{1}{\mathrm{C}_{2}}+\frac{1}{C}_{3}}=1 \\
& =\frac{1}{1}+10 \\
& =\frac{140+84+60}{840}=\frac{284}{840} \\
\frac{1}{\mathrm{C}} & =\frac{284}{840} \\
\Rightarrow \mathrm{C} & =\frac{840}{284}=2.96 \mu \mathrm{f} \\
\therefore \mathrm{C} & =2.96 \mu \mathrm{f}
\end{aligned}
$$

ii. Total charge stored by the capacitor

$$
\begin{aligned}
\mathrm{C} & =\mathrm{Q} / \mathrm{V} \\
\mathrm{Q} & =\mathrm{CV}=2.96 \times 10^{-6} \times 10 \\
\therefore \mathrm{Q} & =2.96 \times 10^{-5} \mathrm{C}
\end{aligned}
$$

iii The Energy stored in the circuit

$$
\mathrm{W}=\quad 1 / 2 \mathrm{VQ} \text { or } 1 / 2 \mathrm{CV}^{2} \text { or } 1 / 2 \underline{\mathrm{Q}}^{2}
$$

$$
\text { ie } W=\frac{10 \times 2.96 \times 10^{-5}}{2}
$$

$$
\therefore \quad W=1.48 \times 10^{-4} \mathrm{~J}
$$

## Question 7

7a. Define the following terms and state their units and symbols:
i Impendance
ii Inductive reactance
iii Capacitive reactance
iv Resistance
b. A coil of resistance $30 \Omega$ and inductance 0.08 H are connected to a supply of $240 \mathrm{~V}, 50 \mathrm{~Hz}$

For other subjects, go to http://www.myschoolgist.com.ng/NABTEB
i Impedance
ii Current in the circuit
iii Value of the capacitance to be connected in series with the coil so that the current shall be 12amps.

Solution
Ai. Impedance is defined as the total or effective opposition offered to the flow of an alternating current due to the presence of an inductor (inductance coil), a capacitor and a resistor in an A C circuit. The unit of impedance is ohms $(\Omega)$ and the symbol is $Z$
Where Z
$Z=\sqrt{R^{2}+X^{2}} L^{2}$ or $\sqrt{R^{2}+X_{c}}{ }_{c}$ or $\sqrt{R^{2}+\left(X_{L}-X_{C}\right)^{2}}$
ii Inductive reactance is defined as the opposition to an alternating current due to the presence of an inductor in an A.C. circuit. The unit is ohms $(\Omega)$ and the symbol is $X_{L}$ where $X_{L} \quad=\quad 2 \pi f L$
iii. Capacitive Reactance is defined as the opposition to an alternating current due to presence of a capacitor in the circuit. The unit is ohms ( $\Omega$ ) and the symbol is $X_{G}$, where $X_{c}=1$

2mfL
iv. Resistance is defined as the opposition which the components or elements or material in a pre resistive circuit offers to the flow of current in a circuit Resistance is represented by a letter R and the unit is ohms $(\Omega)$
b.

i. Impedance, $Z=R^{2}+X_{L}^{2}$

But $X_{L}=2 \pi f L$
$=\quad 2 \times 3.142 \times 50 \times 0.08$
$X_{L}=25.136$
$\mathrm{Z} \quad=\quad 25.14 \Omega$,
$=\sqrt{30^{2}+25^{2}}$
$=\sqrt{900+625}$

For other subjects, go to http://www.myschoolgist.com.ng/NABTEB

NABTEB Past Questions and Answers - Uploaded online www.myschoolgist.com.ng

$$
\begin{aligned}
& =\sqrt{1525} \\
\therefore Z & =\underline{\underline{39.1 \Omega}}
\end{aligned}
$$

ii Current, I in the circuit

$$
\begin{aligned}
\mathrm{I} & =\frac{\mathrm{V}}{\mathrm{Z}}=\frac{240}{39.1}=6.15 \\
\therefore \mathrm{I} & =\underline{6.15 \mathrm{~A}}
\end{aligned}
$$

lii

Current, $I=12 \mathrm{~A}$

$$
Z=\frac{V}{1}=\frac{240}{12}=20 \Omega
$$

The only assumption by which this problem can be solved is to consider a point of resonance. Why?

$$
\begin{aligned}
& \text { ie } X_{L}=X_{C} \\
& 2 \pi f L=\frac{1}{2} \pi f c \\
& 4 \pi^{2 f^{2} L C}=\frac{1}{4 \underline{\pi^{2} f^{2} L}} \\
& =\frac{1}{4 \times(3.142)^{2} \times(50)^{2} \times 0.08} \\
& =\frac{1}{7895.6} \\
& =0.0001266 \\
& \therefore C \quad=\underline{\underline{1.3 \times 10^{-4}}} . F
\end{aligned}
$$

It could also be solved by this process that $\left.Z \sqrt{=R^{2}+( } X_{L}-X_{C}\right)^{2}$
